Take the Offensive Against Brain Injury

The United States Marine Corps' decision to deploy Infrascanner as a standard component in trauma kits for all battalion aid stations marks a significant milestone in the application of the world's only handheld brain hematoma detection device. Now, for the first time ever, the revolutionary application of infrared technology can be applied in a portable, handheld, FDA-cleared, CE Marked device that empowers physicians to know what's happening inside the human skull, even before symptoms appear. There is no faster way to detect and triage subdural, epidural, and intracerebral hematomas. Infrascanner puts the power to heal in the palm of your hand.
